amino acid s acid sequenc

```
The present invention describes a methylase and restriction endonuclease from Thermus filliformis. These are involved in the bacterial restriction-modification system. The genes and protein sequences can be used in the laboratory for the cleavage of nucleic acids.
                                        Disclosure; Column 11-14; 14pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                    A new peptide complex synthesised by Clostridia bacteria comprises the serotype E botulinum neurotoxin and five neurotoxin associated peptides of molecular weights 118, 80, 65, 40 and 18 kDa respectively. The present sequence represents a partial sequence of the 18 kDa peptide. Also claimed are: (1) detecting the serotype E neurotoxin complex in biological samples by: (a) contacting with an antibody or polypeptide specifically binding to a polypeptide of the complex, and (b) detecting antibody- or polypeptide-bound polypeptide, indicating the presence of serotype E. neurotoxin; (2) an antibody binding to the complex, or one of the five neurotoxin associated polypeptides.
                                                                                                                                                                                                                                                isolated from the complex. The complex can be used to produce therapeutios for treating diseases resulting from excessive acetylcholine release from prespection nerve terminals causing undesirable contraction of smooth or skeletal muscle cells and resulting
                                                                                                                                                                                                                                                                                                                                                                               utinary systems, tardive dyskinesia, profuse sweating, lacrimation or mucous secretion. The complex can also be used to produce therapeutics for treating spasticity occurring secondary to brain ischaemia, traumatic injury of the brain or spinal cord, tension headaches, pain caused by sporting injuries or arthritic contractions. The complex may dirther be used, within a carrier to prepare vaccines, useful for, e.g. vaccinating animals against serotype E neurotoxin. The polypeptides can be used for testing foodstuff, or diagnosing vertebrate gastrointestinal, blood or tissue samples, for infection with serotype E
                                                                                                                                                                                                                                                                                                                             in, e.g. spasmodic torticollis, essential tremor, spasmodic dysphonia, charley horse, strabismus, blepharosphasm, oromandibular dystonia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

in gene therapy. The primers are useful for synthesising polynucleotides, detaction and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH13472 represent human cDNA sequences; AAB92446 to AAH3659 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5 end sequence and an oligonucleotide comprising a sequence complementary to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination the 5'-end sequence/3'-end sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        regulates cellular signal transduction and transcriptional activation (e.g. the activation of nuclear factor kappaB). Nucleic acids encoding IKAP have a range of applications including use as translatable transcripts, hybridisation probes, polymerase chain reaction (PCR) primers, diagnostic nucleic acids, use in detecting the presence of IKAP genes and gene transcripts and in detecting or amplifying nucleic acids encoding additional IKAP homologues and structural analogues. In diagnosis IKAP hybridisation probes may be used to identify wild-type acids can be used to modulate cellular expression or intracellular concentration or availability of active IKAP.
          in gene therapy. The primers are useful for synthesising polynucle particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encode, the full-length cDNAs. The primers allow obtaining of the full-length cDNAs casily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH181742 represent human cDNA sequences; AAB92446 to AAH3624 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated, recombinant cDNA sequences encoding human IKAP polypeptides - useful for regulating cellular signal transduction and transcriptional activation
                                                                                                                                                                                                                                            ;

the S'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonuclectides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprising a sequence complementary to a polynucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley-Day syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM 223900]. It was found that mutations in the IKBKAP gene (see AB080565) are associated with FD. The mutation associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type message in a tissue-specific manner. The mutation associated with the nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R656P) in the IKBKAP protein, which is predicted to disrupt a potential phosphorylation site. The IKBKAP nucleic acid sequences are useful for least and subject with FD and for rapid carrier screening. The IKBKAP purposes of the wild-type human reasons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The present invention relates to methods and compositions useful for detecting mutations which cause Familial Dysautonomia (FD, Riley Day syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIN 223900]. It was found that mutations in the IKBKAP gene (see AB080565) are associated with FD. The mutation is associated with the major haplotype of FD, FDI mutation, is a base pair (bp) mutation, where the thymine nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced with a cytosine. This results in skipping of exon 20 in the mRNA from FD patients, although they continue to express varying levels of wild-type message in a tissue-specific manner. The mutation associated with the nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine. This bp mutation causes an arginine to proline missense mutation (R696p) in the IKBKAP protein, which is predicted to disrupt a potential phosphorylation site. The IKBKAP nucleic acid sequences are useful for identifying a subject with FD and for rapid carrier screening. The IKBKAP process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New IKBKAP genes with mutations, useful for identifying a subject with familial dysautonomia (FD), or for rapid carrier screening in the Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: the present sequence was not shown in the specification, but was derived from the human wild-type IKBKAP sequence given in Fig 8.

Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid
                  present invention relates to proteins from Neisseria gonorrhoeae

                                                                                                                                                                                                                                        The invention comprises a method for detecting single nucleotide polymorphisms (SNPs) in genes associated with human bronchial asthma. The method specifically refers to detecting polymorphisms in the gene encoding human I.kappa beta associated protein (T&RP). The invention also comprises primers and probes for use in the method of the invention. The method of the invention is useful for analysis of the etiology of bronchial asthma (especially infant bronchial asthma). The present amino acid sequence represents the human I-kappa beta associated protein.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                  Disclosure; SEQ ID NO 11283; 21pp + Sequence Listing; English.

The present invention describes a gram-negative bacteria comprising a mutation in a gene, where the mutation results in decreased activity of a gene product encoded by the mutated gene. Also described is a method for producing a gram-negative bacteria mutant or an attenuated pasteurellaceae bacteria. The mutated genes have antibacterial activity and can be used in vaccines. The gram-negative bacteria or the attenuated Pasteurellaceae bacteria can be used as vaccines in the fields of human medicine or veterinary medicine, and for identifying products. ABOR3158 to ABOR31578 and ABDF4473 to ABDF5451 represents sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                             New mutant gram-negative bacteria, useful as vaccines and for identifying new anti-bacterial agents that target virulence genes and their products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       forensic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; chromosome mapping; gene mapping; gene therapy; forensic

The present invention relates to virulence genes from Pasteurellaceae. The present sequence is a protein encoded by one such virulence gene. The virulence genes of the present invention may be mutated in order to produce an inactive gene. The inactive virulence gene may in turn be used to produce a vaccine, which is useful for treating bacterial infections such as sept_fcemias, bronchopneumonias, rhinitis and wound infections.

XX

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensits, gene mapping, identification of mutations of mutations of magnostics, forensits, gene mapping, identification of mutations of polypeptide for genetic disorders or other traits and to assess biodiversity.

XX

Claim 20: SEQ ID NO 44820; 103pp; English.

XX

The invention relates to isolated polynucleotide (I) and gene mapping, and in recombinant production of (II). The polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain reaction (PRE) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polypeptide and in diagnostics as expressed sequence therapy techniques (II) (II) is useful in gene therapy techniques (II) (II) is useful in gene therapy techniques (II) (II) as useful for generaling antibodies against it, detecting of contracting an observant protein expression or biological activity (II) (II) and its binding partners are useful for treating in polypeptide in tissue, as molecular weight markers and a for sequence sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and confidence other types of data and products dependent on DNA and amino acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO (CC at the wipo.int/pub/published_pct_csquences.)

Sequence 40, Application US/10099352
Sequence 40, Application No. US200300825691
GENERAL INFORMATION:
APPLICANT: Johnson, Clayton H.
APPLICANT: Work, J. Lyndal
TITLE OF INVENTION: Histoplasma Capsulation Catalase Sequences and Their Use in t
TITLE OF INVENTION: Of Histoplasma Capsulation and Histoplasmosis
FILE REFERENCE: 40715-255988
CURRENT APPLICATION WUMBER: US/10/099,352
CURRENT APPLICATION WUMBER: US 60/275,353
PRIOR APPLICATION WUMBER: US 60/275,353
PRIOR APPLICATION WUMBER: US 60/275,353
NUMBER OF SEQ ID NOS: 48
SOFTWARE: Patentin version 3.1
SEQ ID NO 40

SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane.
SIMILARITY: Contains 1 histidine kinase domain.
SIMILARITY: Contains 1 PAS (PER-ARNT-SIM) dimerization domain.
